

Another hermaphrodite (transgender) person has been murdered. This is the second transgender person to be murdered this year 2017.

Murder rates are very high among persons with hermaphrodite/ transgender type injuries. Most states allow their murderer to use the "transgender panic" defense to avoid the murder charge.

Transgender suicide rate is also incredibly high.

42% !!

about 32% actually die in the attempt. That's one in 3, compared to 4.6% in the general population.

These numbers do NOT reflect suicides among the many uncounted (and miserable) hermaphrodite/transgender people. These people have very difficult lives that they would NEVER choose or wish on others.

Pray that these sweet little babies born into our families are spared some variety of this often initially hidden and usually chemically related birth defect, and pray for this community.

You may unwittingly pray for someone you know and love.

*Hermaphrodites/transgender/transsexual people are born both male and female or some variation of the above. ~ Can this injury occur after birth? Some scientists suspect "yes" but research is not currently available to confirm.
